

Procedure to run a Springboot program

- 1.) Download github folder and Open the Folder.
- 2.) Open terminal and navigate to the github folder.
- 3.) Run command : **docker-compose build**
- 4.) And, then run: **docker-compose up**
- 5.) After that Open a browser and hit **localhost:8080**
- 6.) As soon as you hit the local ip address: Enter username and password mentioned in docker-compose.yaml file which is in the test folder. (ex user: sushil and password: sushil)
- 7.) After logging in, user name and password will be saved in the browser cache.
- 8.) To delete browser cache, open settings and in the browser cache, find localhost ip, and then delete it and restart the browser to refresh the cache.
- 9.) To close the Program, Open terminal and hit ctrl + c.
- 10.) And , then type, **docker-compose down**
- 11.) To see swagger doc api, open **localhost:8080/swagger-ui/index.html**
- 12.) I have used Postman to test and images are available for all the test cases.
